Special relativity says, physics laws should look the same for different observers in different inertial reference frames. In the non-relativistic setting, the coordinates of different reference frames are related by the Euclidean transformation.

6.1. THE LORENTZ GROUPS $O(N,1)$, $SO(N,1)$ AND $SO_0(N,1)$

323 Theorem 6.4 (really, the version for $SO_0(1,n)$) shows that the Lorentz group $SO_0(1,3)$ is generated by the matrices of the form $\begin{pmatrix} 1 & 0 & 0 & P \\ 0 & P^T & 0 & 0 \\ 0 & 0 & A & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix}$ with $P \in \mathbb{R}^3$, $A \in SO(3)$ and the matrices of the form $\begin{pmatrix} \cosh \alpha & \sinh \alpha & 0 & 0 \\ \sinh \alpha & \cosh \alpha & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix}$ with $\alpha \in \mathbb{R}$. This fact will be useful when we prove

Chapter 6 The Lorentz Groups

As we will see further on, the Lorentz group is an isometry group of transformations of a four dimensional vector space, equipped with a quite special $\| \cdot \|$. This is in fact what we call Minkowski space, and it is the basic frame for the work in

2 which are close in space and in time. The argument below is based on the observation that the difference between the values of the scalar field at the two event points is the same in any frame. Since $f(x)$ is a scalar field, the values at a given event is the same before and after a Lorentz transformation: $f(x, 1) = f(x, 2)$.
