Workflow design happens when you map out the sequential tasks involved to take an item from 'initiated' to 'processed'. In the process of workflow design, you get a chance to see the entire process and how data moves seamlessly from step to step. Each task in the workflow should be assigned to either a single human, group of humans, or to a system.

Creating a workflow for a process, on the other hand, involves defining processes that need to be managed throughout the organisation, which may include repeatable projects and grouped tasks. It also requires visualizing, measuring, controlling, reporting, and, improving that process over time, with the goal to increase productivity and/or decrease costs.

How to Get Started Building and Organizing Your Workflow

The Petri net model eventually became the business process logic for the design of workflow systems and software. The 1990's saw workflows evolve from basic, one-size-fits-all diagramming to industry-specific software systems that allow for better process control.

Essential Guide to Workflow Management

Effective infection control workflows require forethought and an adherence to a well-designed strategy. It's easy to become overwhelmed with all the details involved with good infection prevention. Getting lost in the minutiae is common, but having good workflows in place can minimize the opportunity to miss important elements.
