Full text of "Error Control Coding From Theory To Practice"

The general idea of error control codes is to let the encoder calculate extra control bits from the information that we wish to transmit, and to transmit those control bits together with the information. If that is done in a clever way, then the decoder can detect or correct the most probable error patterns.

Chapter 7 Error Control Coding - Linköping University

Noise or Error is the main problem in the signal, which disturbs the reliability of the communication system. Error control coding is the coding procedure done to control the occurrences of errors. These techniques help in Error Detection and Error Correction. There are many different error correcting codes depending upon the mathematical principles applied to them.

(PDF) Error Control Coding - ResearchGate

Forward error correction (FEC) is a process of adding redundant data such as an error-correcting code (ECC) to a message so that it can be recovered by a receiver even when a number of errors (up to the capability of the code being used) were introduced, either during the process of transmission, or on storage.

As I said, I'm not a coding specialist. Until I see a better book, though, this is the one I'll recommend to anyone needing a basic literacy in ECC. If someone needs more than the basics, I'll still recommend this for its introductory content and bibliography.

Introduction to Error Control Coding-I - YouTube

This month we will cover some of the applications and limitations of codes and the theory behind their operation. The traditional role for error-control coding was to make a troublesome channel acceptable by lowering the frequency of error events. The error events could be bit errors, message errors or undetected errors.
